Amaury Saulsberry is the Founder and CEO of Nouvo, a health technology company that is designing and building smart connected products to improve patient outcomes. Nouvo's very first product is a smart pacifier that monitors acidity and temperature levels in a child's saliva as a biomarker for acid reflux and airway complications. The pacifier then sends that data to users' mobile devices. The data can help parents understand symptoms and help streamline the physician's decision making process. Over 20% of babies in the United States of America suffer from some form of GERD (acid reflux) complications. This unmet need affects millions of families across the world.
