The problems in this review are designed to help prepare you for your upcoming exam. Questions pertain to material covered in the course and are intended to reflect the topics likely to appear in the exam. Keep in mind that this worksheet was created by CARE tutors, and while it is thorough, it is not comprehensive. In addition to exam review sessions, CARE also hosts regularly scheduled tutoring hours.

Tutors are available to answer questions, review problems, and help you feel prepared for your exam during these times:

Session 1: Feb 6, 3-5pm Jay, Greg, and Shiv  
Session 2: None

Can’t make it to a session? Here’s our schedule by course:

https://care.engineering.illinois.edu/tutoring-resources/tutoring-schedule-by-course/

Solutions will be available on our website after the last review session that we host.

Step-by-step login for exam review session:

1. Log into Queue @ Illinois
2. Click “New Question”
3. Add your NetID and Name
4. Press “Add to Queue”

Please add yourself to the queue at the beginning of the review session

Good luck with your exam!
Worksheet 1 covers topics that will primarily be on Quiz 1. Problems 1, 6, 8, and 14 cover topics that will be on Quiz 2.

Concepts

1. **True or False:** The light intensity at any location on a screen is proportional to the probability that a photon arrives at that location, and that probability density is given by the square of the absolute value of the wavefunction.

2. In a photoelectric effect demonstration, the intensity of the incident light is gradually increased, but no photocurrent is detected. Provide an explanation for this result.

3. Three speakers lie on the perimeter of a circle. The sound intensity at each source is $I_0$ while the total intensity at the center of the circle is observed to be zero. Use phasors to determine the relative phase shift of each speaker such that this is possible.

4. A laser with time-varying frequency is directed at a barrier with a narrow slit followed by a screen. Assuming the laser intensity is constant, as the frequency increases, how does the number of photons per second arriving at the screen change?

5. The wave equation is a second order linear partial differential equation. Let $f$ and $g$ be any two solutions to the wave equations. Which of the following is also a solution? Select all that apply.
   a) $y = fg$
   b) $y = (fg)^2$
   c) $y = 2f + 3g$
   d) $y = g - 4f$
   e) $y = \left(\frac{df}{dt} + \frac{dg}{dt}\right)^2$

6. Simplify the following expression over the real numbers: $e^{ik\theta} + e^{-ik\theta}$
7. A laser is directed at a barrier with a narrow slit followed by a screen. Applying a small angle approximation, if the slit width is halved while the wavelength is doubled, by what factor does the location of the first diffraction minimum change?

8. Given $\Psi(x) = N\sqrt{\omega}ix$ over some region of space, compute the probability density function associated with this wavefunction.

9. A wave is traveling along the positive $x$-axis with speed 5 meters per second. Which equation could describe this wave?

(a) $0.5e^{-(3x-4t)^2}$
(b) $\sin(12x + 2.6t)$
(c) $3\cos(x - 0.3\pi t)$
(d) $e^{-(x-5t)^4}$
(e) $\sin^2(x + t - \pi)$
Calculations

10. An interferometer has two arms of equal length \((L_1 = L_2)\). A 200 W laser with wavelength 1064 nm is directed at the central beam splitter (shown below).

What is the minimum increase in \(L_2\) required so that only 100 W goes to the detector? (Note that when the arms are of equal length, the detector receives 200 W).

a) 266 nm  
b) 133 nm  
c) 532 nm
11. A wave propagating through the ocean is measured by a sensor and can be described by the equation \( f(x,t) = \cos(0.4x - 2t) \). What is the wavelength, frequency and amplitude of the wave?

12. In which direction is the wave from the previous question traveling?
   a) \(-x\)
   b) \(+x\)
   c) The direction is time dependent

13. A spacecraft is being pushed by a laser of wavelength 400 nm emitting photons at a rate of \(10^{22}\) photons per second. Calculate the acceleration of the spacecraft given its mass is 4000 kg. Values are given in meters per second.
   a) \(3.25 \times 10^{-6}\)
   b) \(1.53 \times 10^{-3}\)
   c) \(4.14 \times 10^{-9}\)
   d) \(1.7 \times 10^{-5}\)
   e) \(5.5 \times 10^{-4}\)

14. Compute the magnitude of the normalization constant for \(\Psi(x) = Ne^{ikx}\) over the interval \(0 \leq x \leq 3\). Assume the wavefunction equals zero for all other regions of space.
   a) 0.333
   b) 0.577
   c) 0.816

15. Light with wavelength 100 nm is incident on a metal. The speed of the ejected photoelectrons is measured to be \(10^6\) meters per second. Find the work function of this metal.
   a) \(1.99 \times 10^{-18}\)
   b) \(1.53 \times 10^{-18}\)
   c) \(4.55 \times 10^{-18}\)
16. An interferometer with equal arm lengths is sourced by a laser of wavelength 700 µm. If the length of one arm is increased by 0.12 mm, by what amount are the waves out of phase?

17. Continuing from the previous question, assuming that the intensity received at the detector was 4 W/m² when the arm lengths were equal, what is the new intensity? Values are given in W/m²
   a) 2.95
   b) 0
   c) 0.898
   d) 1.21
   e) 4

18. The distance to the first minimum of a circular diffraction pattern is found to be 0.012 cm from the center. Assuming the distance to the screen is 10 mm and the diameter of the opening is 200 µm, what is the wavelength of the light used? Values are given in µm
   a) 1.97
   b) 2.28
   c) 0.94

19. Below are two waves undergoing interference. Sketch the resulting waveform and determine the amplitude. What would the amplitude of this wave be if interference was constructive?
