

1. [10 points] How much heat is required to heat six moles of O_2 gas from 300 K to 375 K

a) [5 points] at a constant volume of 0.2 m^3 ?

b) [5 points] starting with $V=0.2 \text{ m}^3$, but heating at constant pressure?

2. [10 points] A homeowner wants to add a new window to one of the walls in their house. The wall already has a window and the second window is planned to be identical in size:

The wall is 3 m high and 6 m wide, while the window is 2 m high and 1 m wide, as shown. The walls are 10cm thick and the glass is 1cm thick. On a cold day in Chicago, the outside temperature is -14° C , and the homeowner wants to keep the temperature inside his house at $+20^\circ \text{ C}$. Suppose the thermal conductivity of the solid part of the wall is 0.30 W/mK and the thermal conductivity of the window is 4.50 W/mK , what is the ratio, $H_{\text{new}}/H_{\text{old}}$, of the new heat loss to the old heat loss through this wall? Explain your reasoning.
