1. Issue Identified:
   Retro-Reflectivity of Traffic Control Devices

2. Summary of Problem:
   Construction field personnel do not consistently and uniformly evaluate the need to replace traffic control devices in the field because of inadequate retro-reflectivity.

3. Desired Results / Outcome:
   The desired outcome of this project is an inspection method that determines when field traffic devices need to be replaced because of inadequate retro-reflectivity. This could be a field test method or a winter inspection method for the upcoming construction season.
