The Influence of Physical Activity on Cognitive & Brain Health of Older Adults: A summary and future directions – including an increasing role for AI

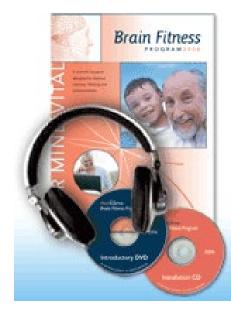

ACTER STATEMENT REAL FOR A CONTRACT OF THE STATEMENT OF T

of Your Body for the Rest of Your Life

> Marilyn Mollat, PT, PhD Carole B. Lewis, PT, PhD

Art Kramer & colleagues Northeastern University, University of Illinois, & other collaborators

We all live in yellow submarine, yellow submarine, yellow submarine. And our friends are all aboard, Many more of them live next door.

# Roadmap for Today .....

• What do we currently know about the molecular and cellular brain mechanisms of physical activity – animal models.

• Meta-analytic studies of physical activity effects on cognition.

• Exercise and physical activity effects on older human minds & brains – structure, function and functional connectivity.

• Is there a point of no-return for exercise effects on brain & cognition?

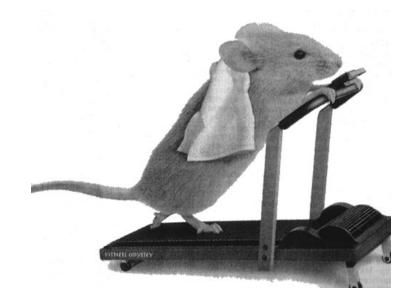

• Fitness effects across the lifespan.

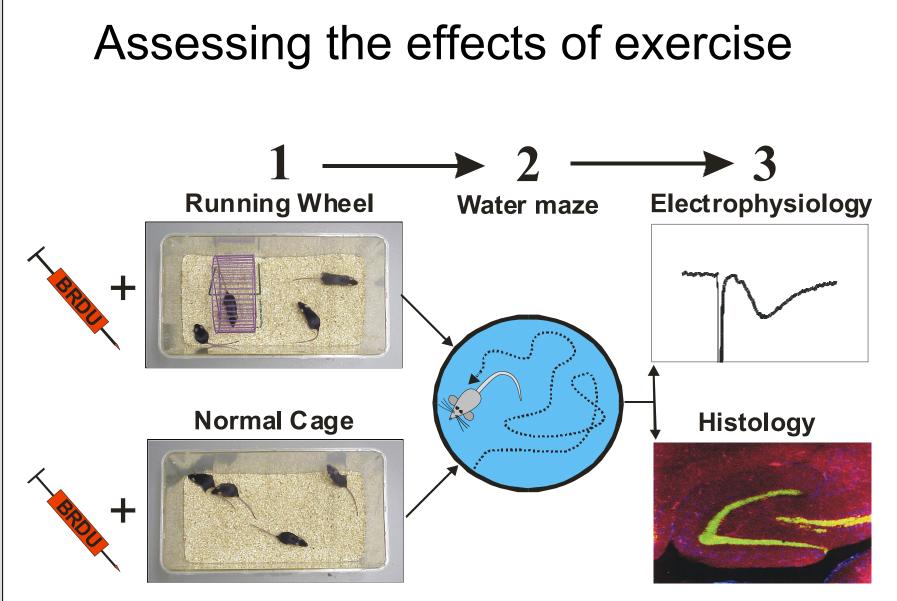

• What studies need to be done to further advance our understanding of the link between exercise & cognition ?

## **Enriched (complex) environments include:**

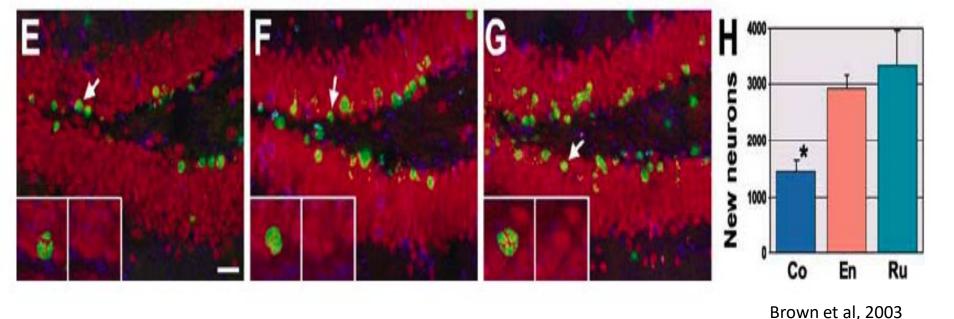

Van Praag et al., 1999

ALSO .....

- increases in neurotrophins (e.g. BDNF, IGF1, VEGF, etc.)
- enhanced synaptogenesis
- enhanced angiogenesis
- increased production of various neurotransmitters
- reduced beta amyloid protein in transgene mouse models
- increased telomere length
- increased expression of genes associated with plasticity & function, downregulates genes associated with oxidative stress
- enhanced learning & memory

mitochondria

# Roadmap for Today .....

• What do we currently know about the molecular and cellular brain mechanisms of physical activity – animal models.

• Meta-analytic studies of physical activity effects on cognition.

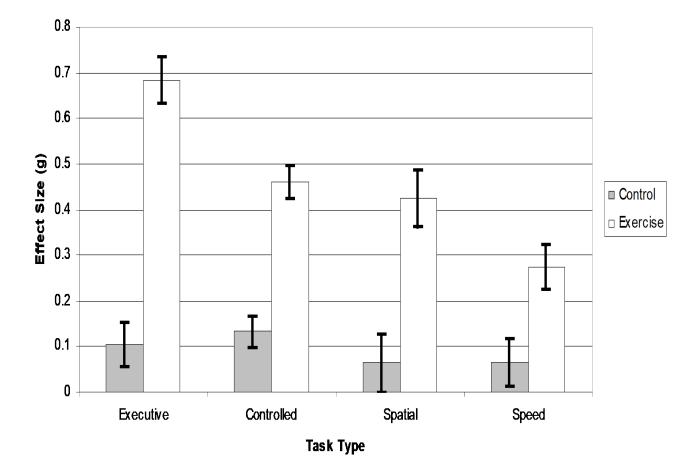

• Exercise and physical activity effects on older human minds & brains – structure, function and functional connectivity.

• Is there a point of no-return for exercise effects on brain & cognition?

• Fitness effects across the lifespan.

• What studies need to be done to further advance our understanding of the link between exercise & cognition ?

 Across intervention studies (with normal elderly) that find positive effects of fitness training on cognition the cognitive benefits are quite broad – with larger benefits for some cognitive processes ...

# There have been lots and lots of additional meta-analyses since 2003 .....

Neurobiology of Aging Volume 79, July 2019, Pages 119-130

Review

Impact of exercise training on physical and cognitive function among older adults: a systematic review and meta-analysis

Ryan S. Falck <sup>a, b, c, 1</sup>, Jennifer C. Davis <sup>d, 1</sup>, John R. Best <sup>a, b, c</sup>, Rachel A. Crockett <sup>a, b, c</sup>, Teresa Liu-Ambrose <sup>a, b, c</sup> 옷 평

#### Highlights

- Maintaining physical and cognitive function is critical for healthy aging.
- Physical function and cognitive function are linked and share common mechanisms.
- Exercise training improves physical function and cognitive function.
- Exercise-induced improvements in physical and cognitive function are associated.

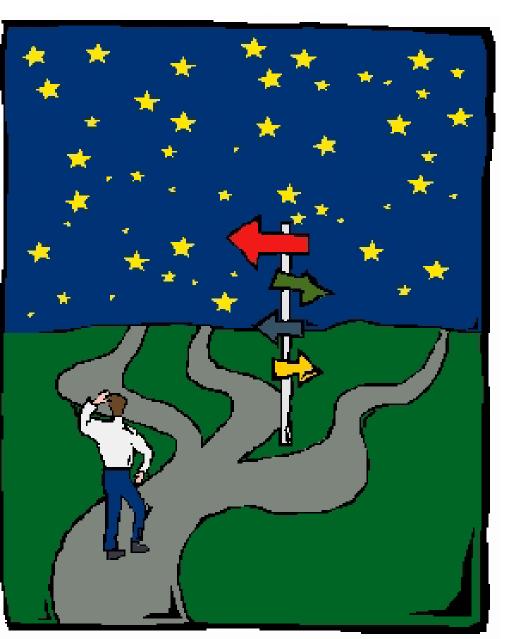

# Cognitive benefits of exercise interventions: an fMRI activation likelihood estimation meta-analysis

Qian Yu<sup>1</sup> · Fabian Herold<sup>2</sup> · Benjamin Becker<sup>3</sup> · Ben Klugah-Brown<sup>3</sup> · Yanjie Zhang<sup>1</sup> · Stephane Perrey<sup>4</sup> · Nicola Veronese<sup>5</sup> · Notger G. Müller<sup>2</sup> · Arthur F. Kramer<sup>6,7</sup> · Liye Zou<sup>1</sup>

Received: 27 November 2020 / Accepted: 26 February 2021

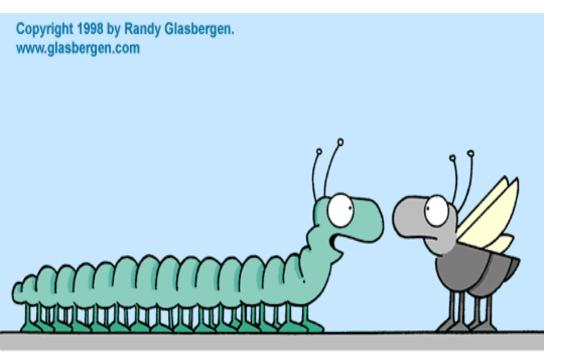

Shorter exercise intervention durations induced changes with regions connected to frontoparietal and default mode networks while longer duration interventions induced changes with regions connected to frontoparietal and dorsal attention networks

# Roadmap for Today .....

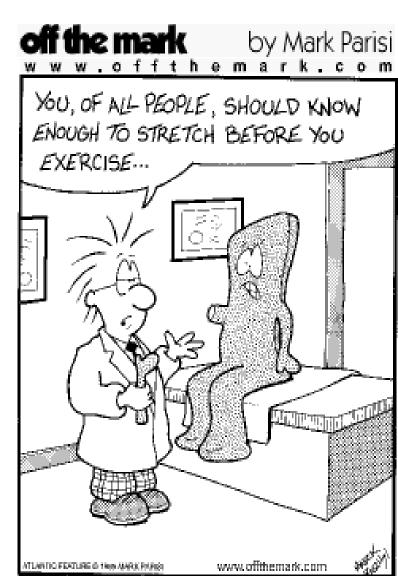

- What do we currently know about the molecular and cellular brain mechanisms of physical activity animal models.
- Meta-analytic studies of physical activity effects on cognition.
- Exercise and physical activity effects on older human minds & brains structure, function and functional connectivity.
- Is there a point of no-return for exercise effects on brain & cognition?
- Fitness effects across the lifespan.
- What studies need to be done to further advance our understanding of the link between exercise & cognition ?

## **TYPICAL FITNESS INTERVENTIONS**

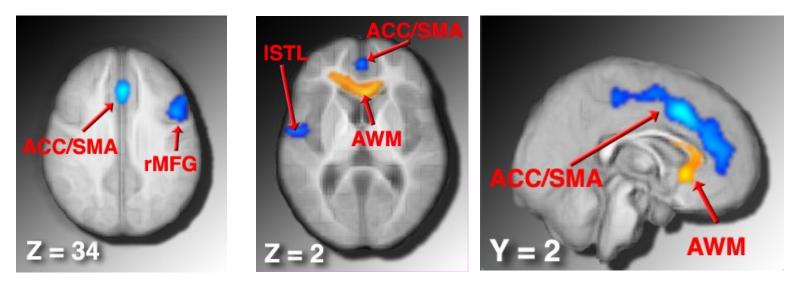

"I tried all the fitness fads, but my doctor was right all along—walking is still the best exercise."

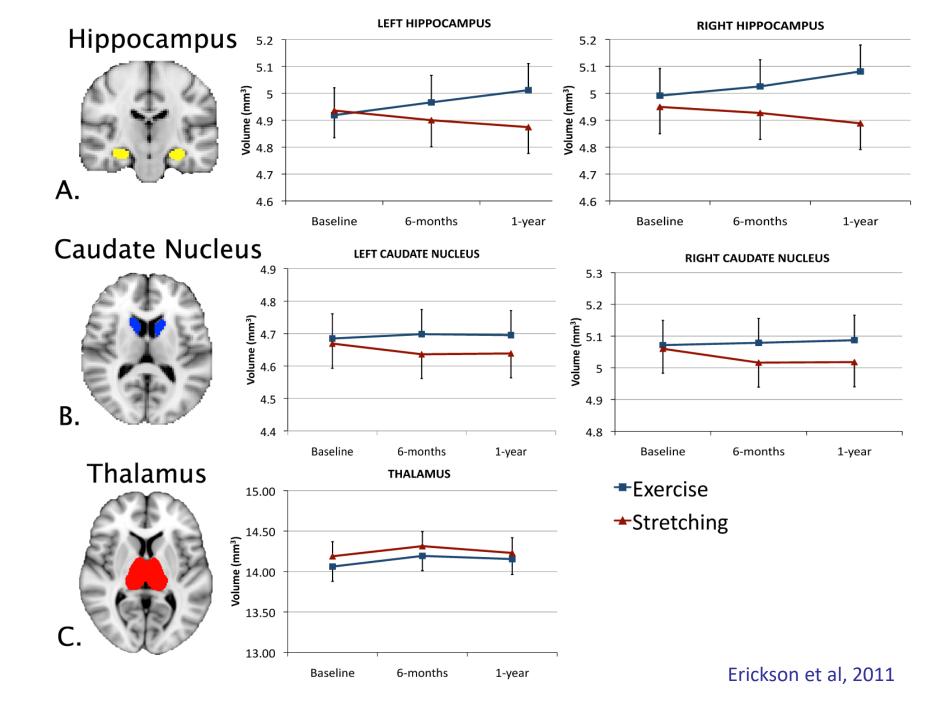

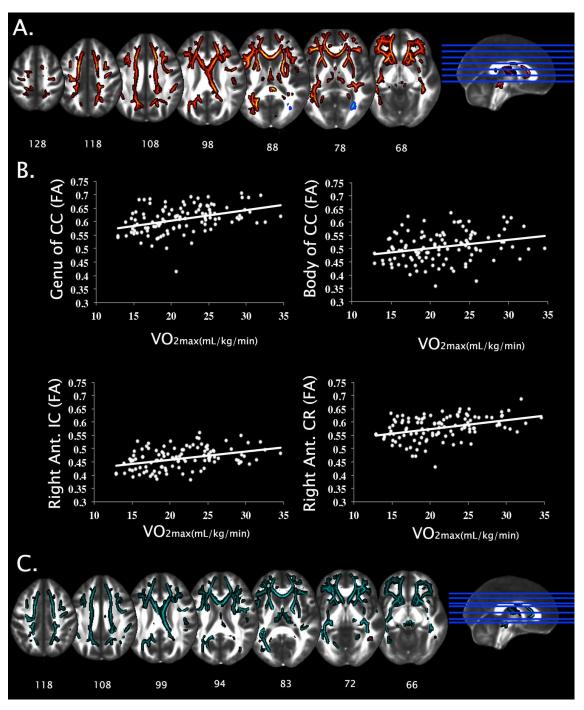

# Exercising your brain structure .....

Although much is known about <u>fitness training effects</u> on brain function with non-human animals there is a dearth of knowledge of fitness training effects with humans ......

Colcombe et al, 2006

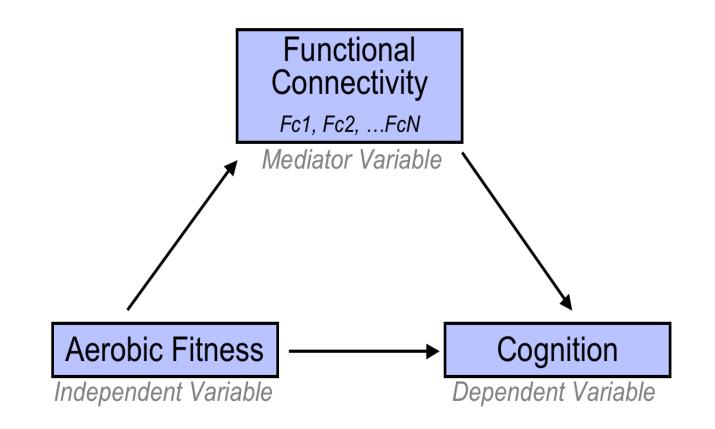

Clusters of voxels where fitness was significantly associated with FA in multiple samples of 100+ older participants.

**Mediation analysis** showed significant indirect associations between CRF and spatial working memory performance through distributed white matter regions, highlighted in cyan in Figure 1C.

> Burzynska et al, 2014 Oberlin et al, 2016

# Exercising your brain function .....

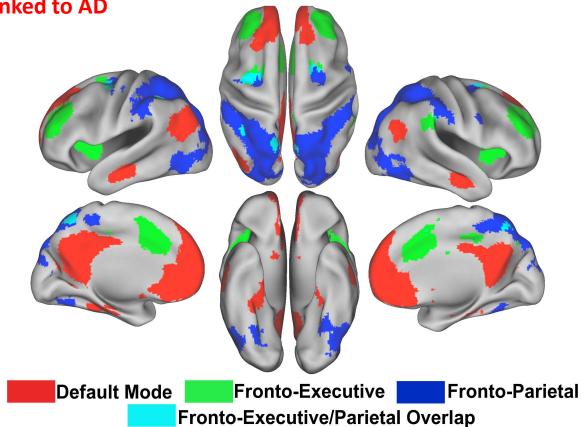

## Is aerobic fitness associated with better Functional connectivity?

# Cognitively relevant brain networks

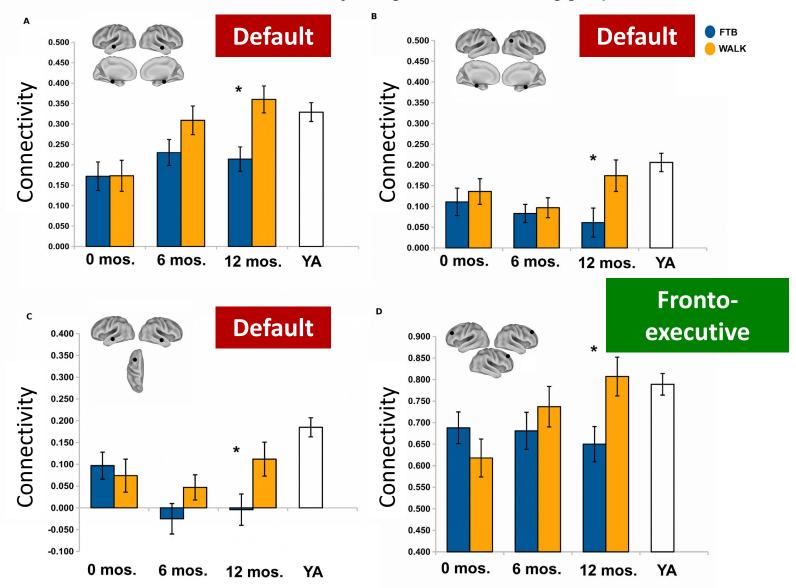

- deactivated during goaldirected attention
- active at rest, inward thought
  r executive functions, speed, memory processes
- dysfunction linked to AD

- stable, sustained maintenance of task set
- monitor for errors
- maintain associations between action-outcome
- Rapid, online filtering of attention
- top-down control
- working memory

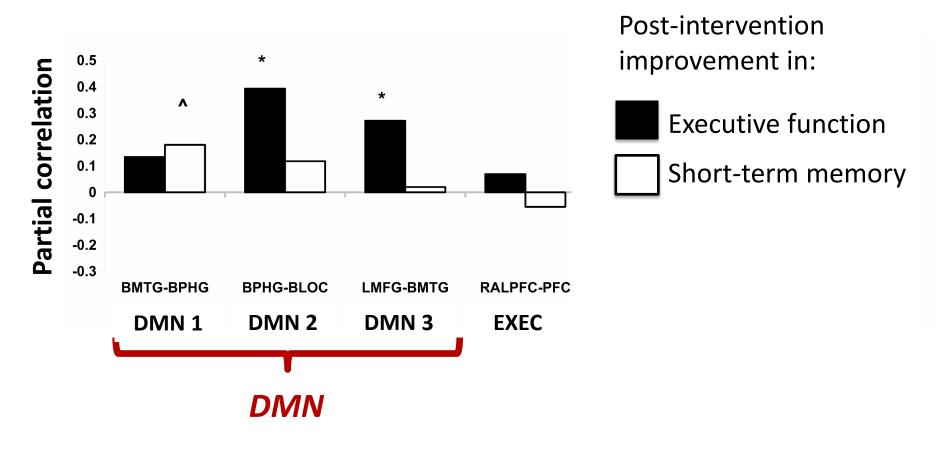

## Improvements in networks post-exercise?

Functional connectivity changes in favor of walking group

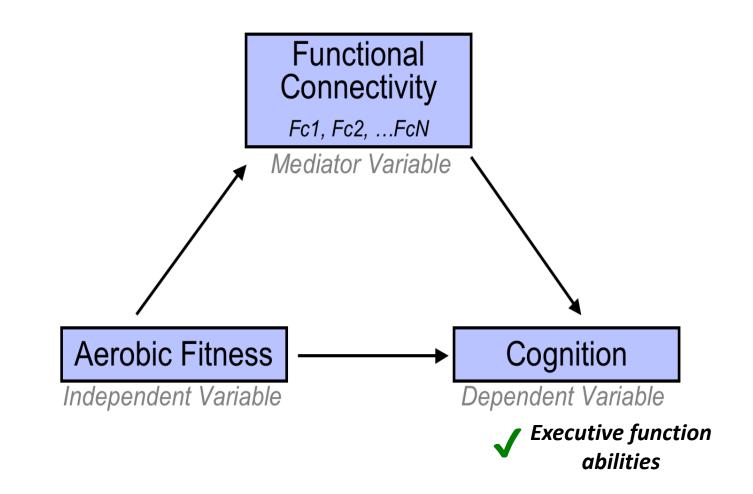

Voss et al., 2010, 2016

# **Brain-Behavior associations**

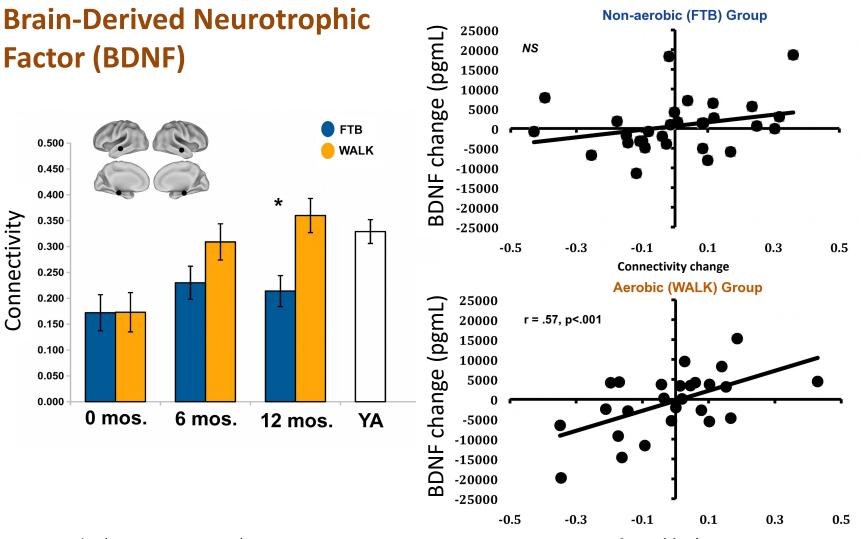

Post-intervention change in connectivity

## Is aerobic fitness associated with better Functional connectivity?

# What are the neurobiological mechanisms for exercise-induced brain plasticity?

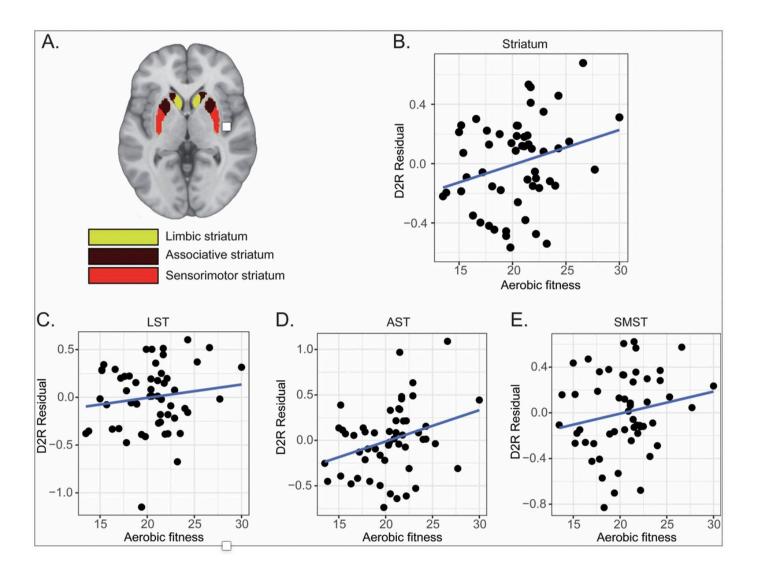

Voss, et al., (2010, 2013, 2016)

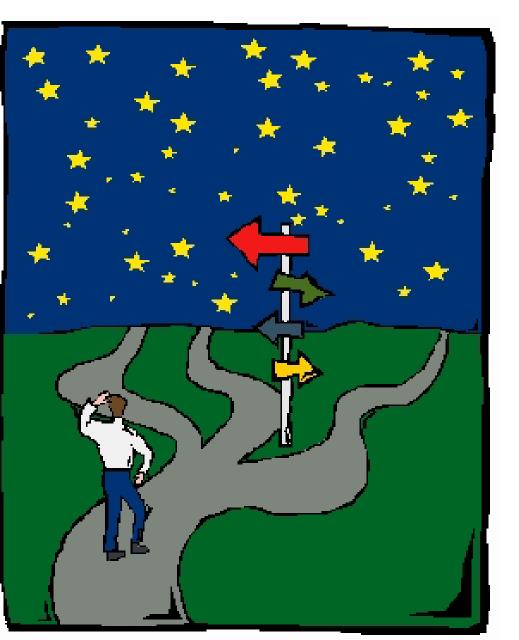

Connectivity change

#### Higher striatal D2-receptor availability in aerobically fit older adults

Lars S Jonasson<sup>1234\*</sup>, Lars Nyberg<sup>124</sup>, Arthur F Kramer<sup>56</sup>, Jan Axelsson<sup>27</sup>, Katrine Riklund<sup>12</sup>, CJ Boraxbekk<sup>238</sup> (2019)

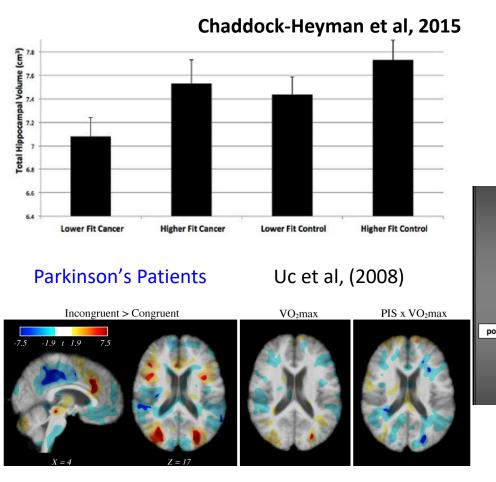

# Roadmap for Today .....

- What do we currently know about the molecular and cellular brain mechanisms of physical activity animal models.
- Exercise versus cognitive training and human performance and cognition.
- Exercise and physical effects on older human minds & brains structure, function and functional connectivity.
- Is there a point of no-return for exercise effects on brain & cognition?
- Fitness effects across the lifespan.
- What studies need to be done to further advance our understanding of the link between exercise & cognition ?

# Is there a point of no-return with regard to exercise benefits on cognition and brain?

<section-header>

 Differences in gray matter volume & white matter integrity (via DTI) as a function of fitness are correlated with processing speed

• Fitness related differences in fMRI activation pattern are correlated with measures of attentional control and inhibition

What about those at risk for dementia and those with forms of dementia?

### What about exercise effects on brain & cognitive function of children?

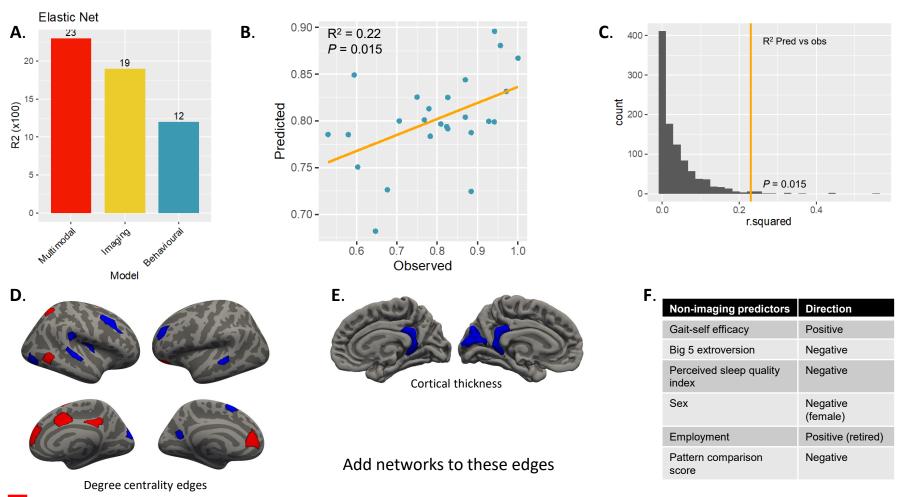

Some examples of how we might enhance our study of lifestyle benefits on healthy brains and minds --

With machine learning and other varieties of Artificial Intelligence

## PREDICTING ADHERENCE TO EXERCISE PROGRAMS Elastic Net models aid prediction

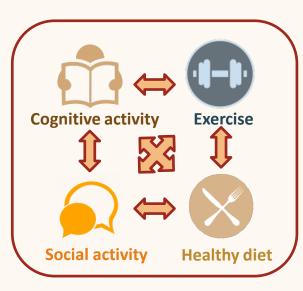

B through C illustrates results from the Multimodal model

R<sup>2</sup> represents the squared correlation between the observed (train data) and predicted (test data) values

Morris et al, 2021

# To what extent does adherence to good *lifestyle practices* (for high risk older adults) relate to brain and mental health?

High-risk older adults

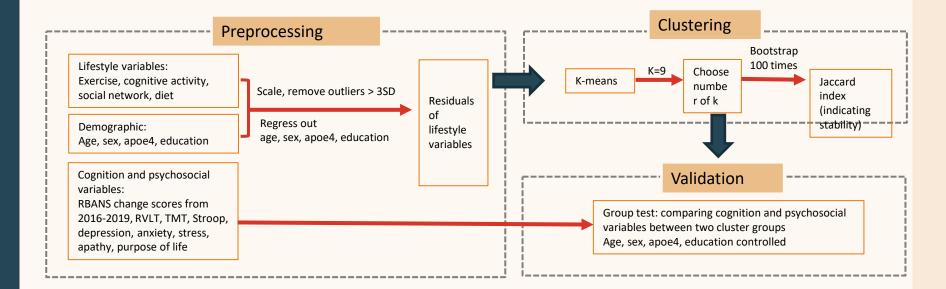

- Prevent up to 40% dementia risk
- Younger structure-based brain age
- Greater functional connectivity in frontal, temporal and motor areas
- Lower Aβ burden and higher global functions

Ai et al, 2023

# Do individuals have different profiles of multidomain lifestyle adherence?

#### **K-means clustering process**

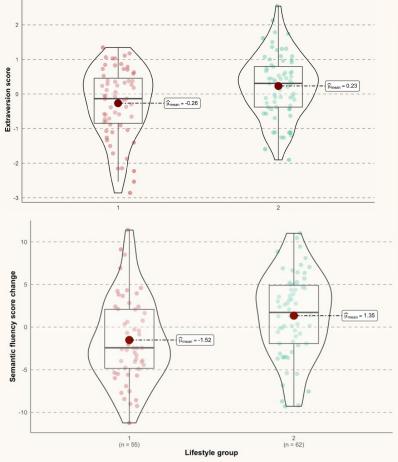

# Individuals have different profiles of multidomain lifestyle adherence

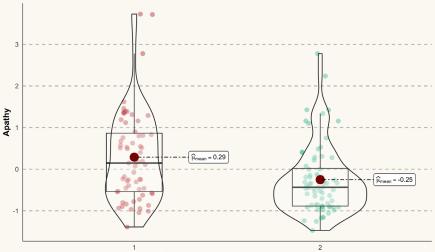

**K-means results** 

## 

- Adherence group
- Non-adherence group

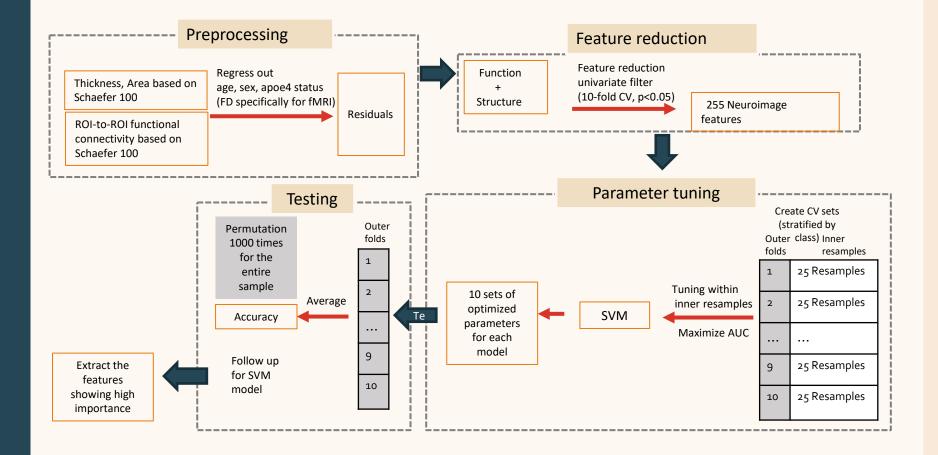

### Different profiles of multidomain lifestyle adherence are associated with different features of mental health and cognition

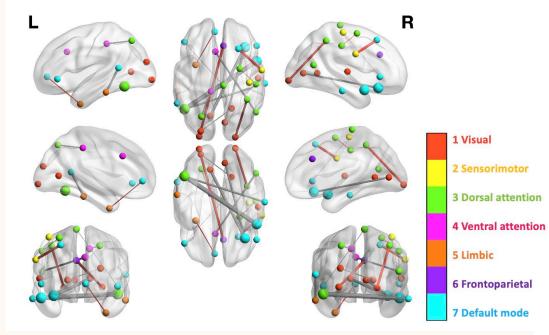

- Non-adherence group
- Adherence group

# Do distinct lifestyle profiles show neurobiological differences ?

#### Do lifestyle profiles have neurobiological distinctions?

#### Study One

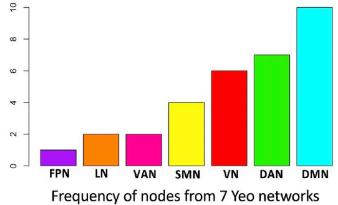

#### Red edges:

Adherence group had greater functional connectivity values than Non-adherence group

#### Grey edges:

Non-adherence group had greater functional connectivity values than adherence group

#### Multidimensional Digital Biomarker of Cognitive Health:

Unobtrusive and Continuous Monitoring of Cognitive Changes Using Smartphones

# Maciej Kos

F99/K00 NIH Fellow

#### Why is cognitive health important? Trajectories of cognitive impairments

Subjective	Mild	Alzheimer's
cognitive	cognitive	disease
impairment	impairment	

#### Problem:

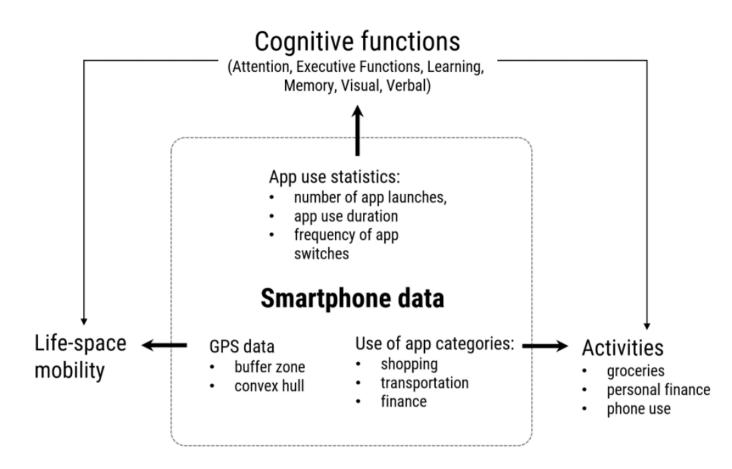

<u>No robust and affordable</u> way to <u>monitoring subtle</u> <u>changes in cognitive functions</u> over time to:

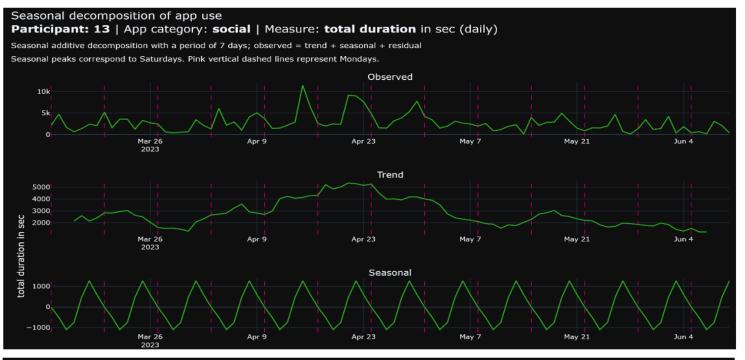

- develop efficacious therapeutics
- personalize treatments

#### Proposed solution (long term):

Multidimensional <u>digital biomarker of cognitive changes</u> to augment existing methods:

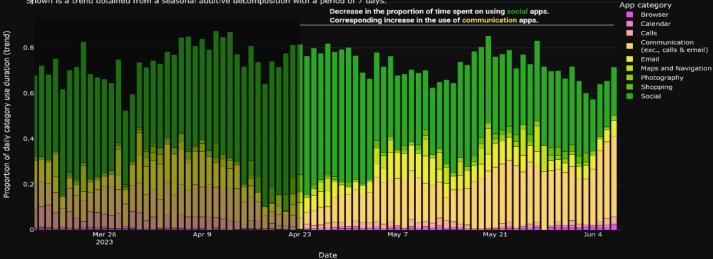

- combines AI/ML methods with mechanistic modeling
- based on smartphone data collected continuously and unobtrusively

#### Replacement Effect **Participant: 13 | Proportion of daily category use duration** (trend) [Only select categories shown]

'Proportion of daily category use duration' is a daily total duration of using apps in category as a proportion of daily total durations in all categories. Shown is a trend obtained from a seasonal additive decomposition with a period of 7 days.

Smartphone based estimates of IADLs significantly correlate with self-reports of IADLs.

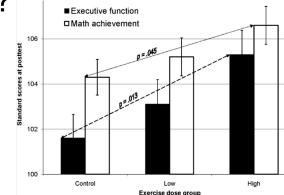

# To summarize:

# Relatively brief fitness interventions (with older couch potatoes – and hi & low fit kid's ....):

- Improve a variety of perceptual & cognitive abilities
- Increase brain volume in regions which normally show age-related decline - including the hippocampus (and increases are often correlated with performance improvements)
- Change functional brain networks, often in the direction of younger adults, associated with improvements in cognition & performance.
- Promising fitness cognitive & brain effects with children.
- Not covered today but .... exercise decreases anxiety and depression and increase self esteem & self efficacy

# Where to go from here?

- Understanding boundary conditions on exercise effects (e.g. Sink et al., 2015 – 24 month RCT)
- More study combining different interventions
  - Social, physical activity, cognitive activity, diet ....
  - When, how much, sequence .....
  - Common or separate mechanisms/pathways?
- Genetic moderators of the relationship between
   interventions and cognition & brain
- What factors predict adherence to exercise?
- Beyond the laboratory door .....

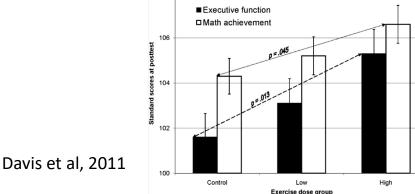

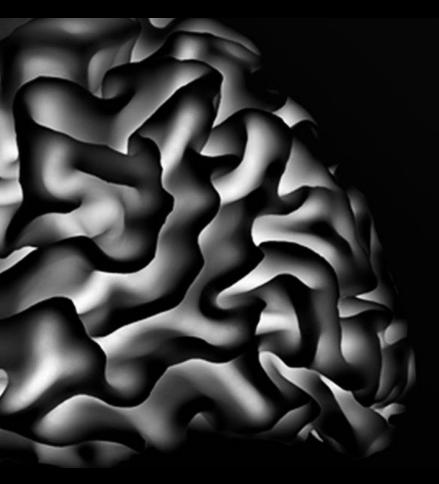

Davis et al, 2011

Analogical Reasoning	Fitness only	0.50	Accuracy

Significant effect size increases of up to 0.86

(relative to the active control) in multiple measures of transfer to Adaptive Reasoning and Problem Solving

> 250 18 to 44 year old participants

Resistance

training

#### The What

Aerobic

training

Different types of exercise may benefit cognitive and brain health outcomes. The moderating role of training parameters such as frequency, intensity, and session duration remains unclear

#### The When

Investigations have targeted individuals in late-life. Evidence for the effects of exercise in mid-life is limited. Interventions in mid-life could more successfully delay the onset of cognitive impairment and reduce

dementia risk

Next Steps The effect of exercise is small, which may reflect

variability across studies in training parameters, participant characteristics, outcome assessment, and control conditions. Evidence from diverse samples is also very scarce. Future trials need to address these limitations

Methodology and reporting

Sex, gender, race/ethnicity, and socioeconomic status Prodromal Alzheimer's disease

#### The Who

Cerebrovascular

disease

Trials have focused on those with and without overt cognitive impairment. Less is known about individuals with specific risk factors, including those with cerebrovascular pathology, early β-amyloid accumulation, or cardiometabolic diseases

#### The How

Knowledge of the mechanisms underlying the effects of exercise on cognition is still limited. Trials have focused on adaptations

in grey matter structure. Other candidates include white matter structure, neural activation, and cerebrovascular function

Angiogenesis and neurovascular

coupling

Silva et al. 2024

Axonal sprouting. myelination, and overall white matter integrity

Dendritic branching and synaptic plasticty

Non-communicable

chronic conditions

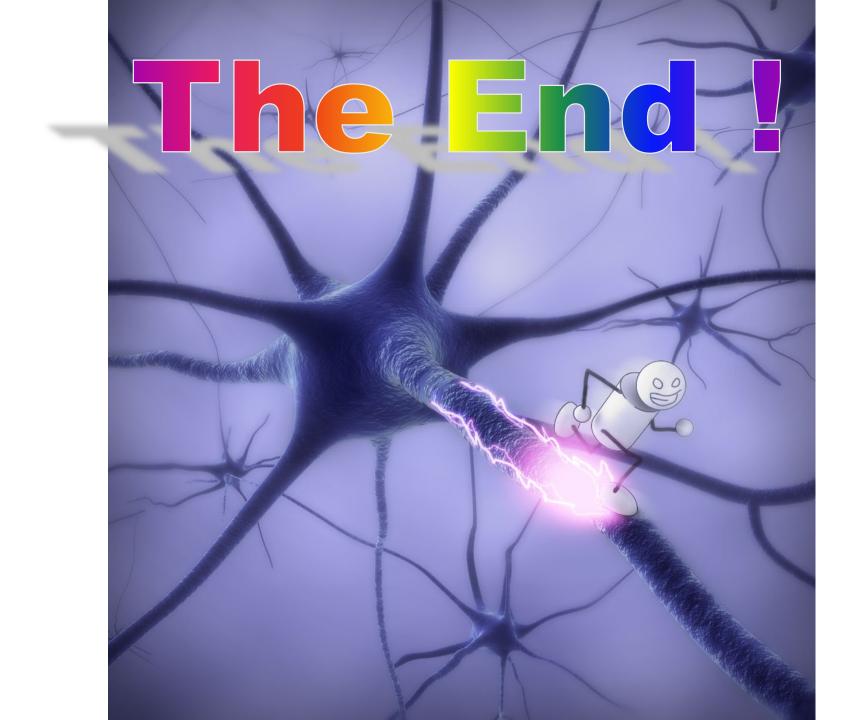

Balance and

flexibility

#### **Center for Cognitive & Brain Health**

#### **OVERARCHING VISION:**

To use our knowledge of brains, minds & bodies to guide current and future generations to happier healthier lives through novel interdisciplinary interventions.

To accomplish this, we investigate the effects of lifestyle, early life experiences, the arts, the aging process, demographics, genetics and health behaviors on brain and cognition.

We bring to bear multiple perspectives and methodologies to explicate mechanisms of brain health and disease to improve the lives of individuals across the lifespan:

- computational modeling
- state of the art multimodal neuroimaging
- sophisticated behavioral paradigms
- Interventions
- analyses of large data sets

Currently include 18 interdisciplinary faculty (and lots of post-doc's and students) from 4 different colleges – with more to come .....

## What about implications for the real-world ?

# What about implications for the real-world ?

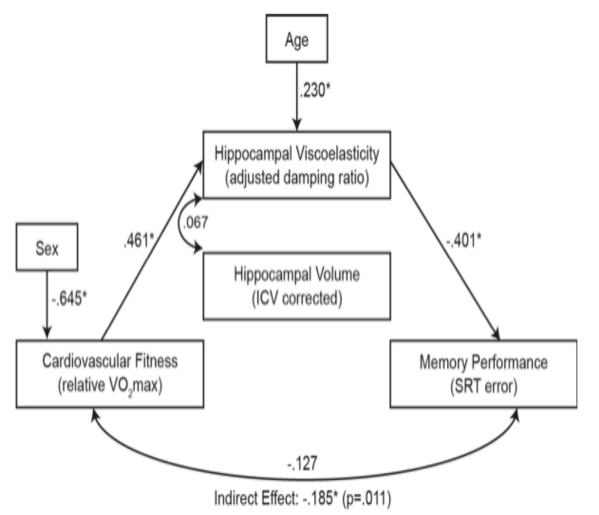

# Some new tools & measures for studying, fitness, brain and cognition and ...

**Fig 4.** Path model testing the effect of aerobic fitness on relational memory mediated by hippocampal  $\xi'$  accounting for hippocampal volume. Regression path values are standardized coefficients. Asterisks indicate significance (p<.05).

Schwarb et al (2017)

Also individual differences in variability in the fMRI (BOLD) signal is useful in predicting & tracking exercise benefits for cognitive & brain health

**Fig 4.** Path model testing the effect of aerobic fitness on relational memory mediated by hippocampal  $\xi'$  accounting for hippocampal volume. Regression path values are standardized coefficients. Asterisks indicate significance (p<.05).

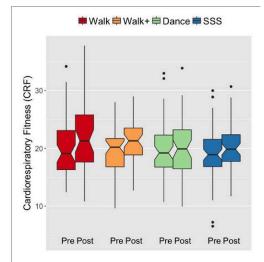

Can we predict future benefits of fitness training on cognitive and brain health ?

# Can we predict future benefits of fitness training on cognitive and brain health ?

- Brain networks exhibit a modular organization, comprised of separable sub-networks or modules.
- Networks with high modularity have dense connections within networks and sparser connections between networks.
- More modular networks allow for more efficient & greater adaptive reorganization in response to changing demands.
- We propose that network modularity may predict outcomes of interventions including when baseline behavioral measures may not reliably distinguish between individuals or cannot be reliably obtained.
  - Consistent with the literature on cognitive training benefits for younger adults, older adults, and TBI patients.

 6 month exercise intervention, 4 groups,
 60 to 85 year olds, composite measure of Executive Function, 100+ participants.
